

1. I chose to use a divergent color scheme to show the differences in where flow was negative and positive to better illustrate the flows of families in and out of states. The bright pink and green are very contrasting and I think illustrates this well. I just used black for the nodes and the flows because it contrasts nicely with the lighter pink and green so it is easily readable and understandable without being too much.
2. The areas that had the most family trees leaving were mainly in the Eastern states, as during this time, migration west was still occurring. The states that had that were gaining more families were in the middle of the country, as those families that left the East headed west. The most flows were occurring in the Midwest mainly, as many families were changing states, but there was still mainly net positive occurring. It is interesting how we see more negative colors in the west, but the volume of flows was occurring in the middle of the country. I did try to change the map flows to be manual breaks, but the map wouldn't update.
